

10X: Power System Technology 10 Years Ahead of Industry – International Standards- Based Communications

David Dolezilek
International Technical Director

An aerial view of the Dubai skyline at dusk or dawn, featuring several prominent skyscrapers. The Burj Khalifa is visible on the left, and the Burj Khalifa is visible on the right. The text '10x' is overlaid in the center, with '10' in white and 'x' in red.

Information Technology (IT) Methods Jeopardize Operational Technology (OT) ECSs

- IT technology is often “fit for use” – replaces serial cables and communications processors with Ethernet network
- IT Ethernet moves data with IP packets
- Upon assembly, Ethernet appears to work but performance is unknown

Engineers Need to Specify, Design, Build, and Test

- Data exchange needs service level specification (SLS)
- SLS requires “fit for purpose” – Ethernet replacement of serial signal exchange must satisfy protection and automation
- Design must include service level agreement (SLA) – performance, gaps, risks, mitigations

International Standards Drove the Energy Control System (ECS) Specification

1984

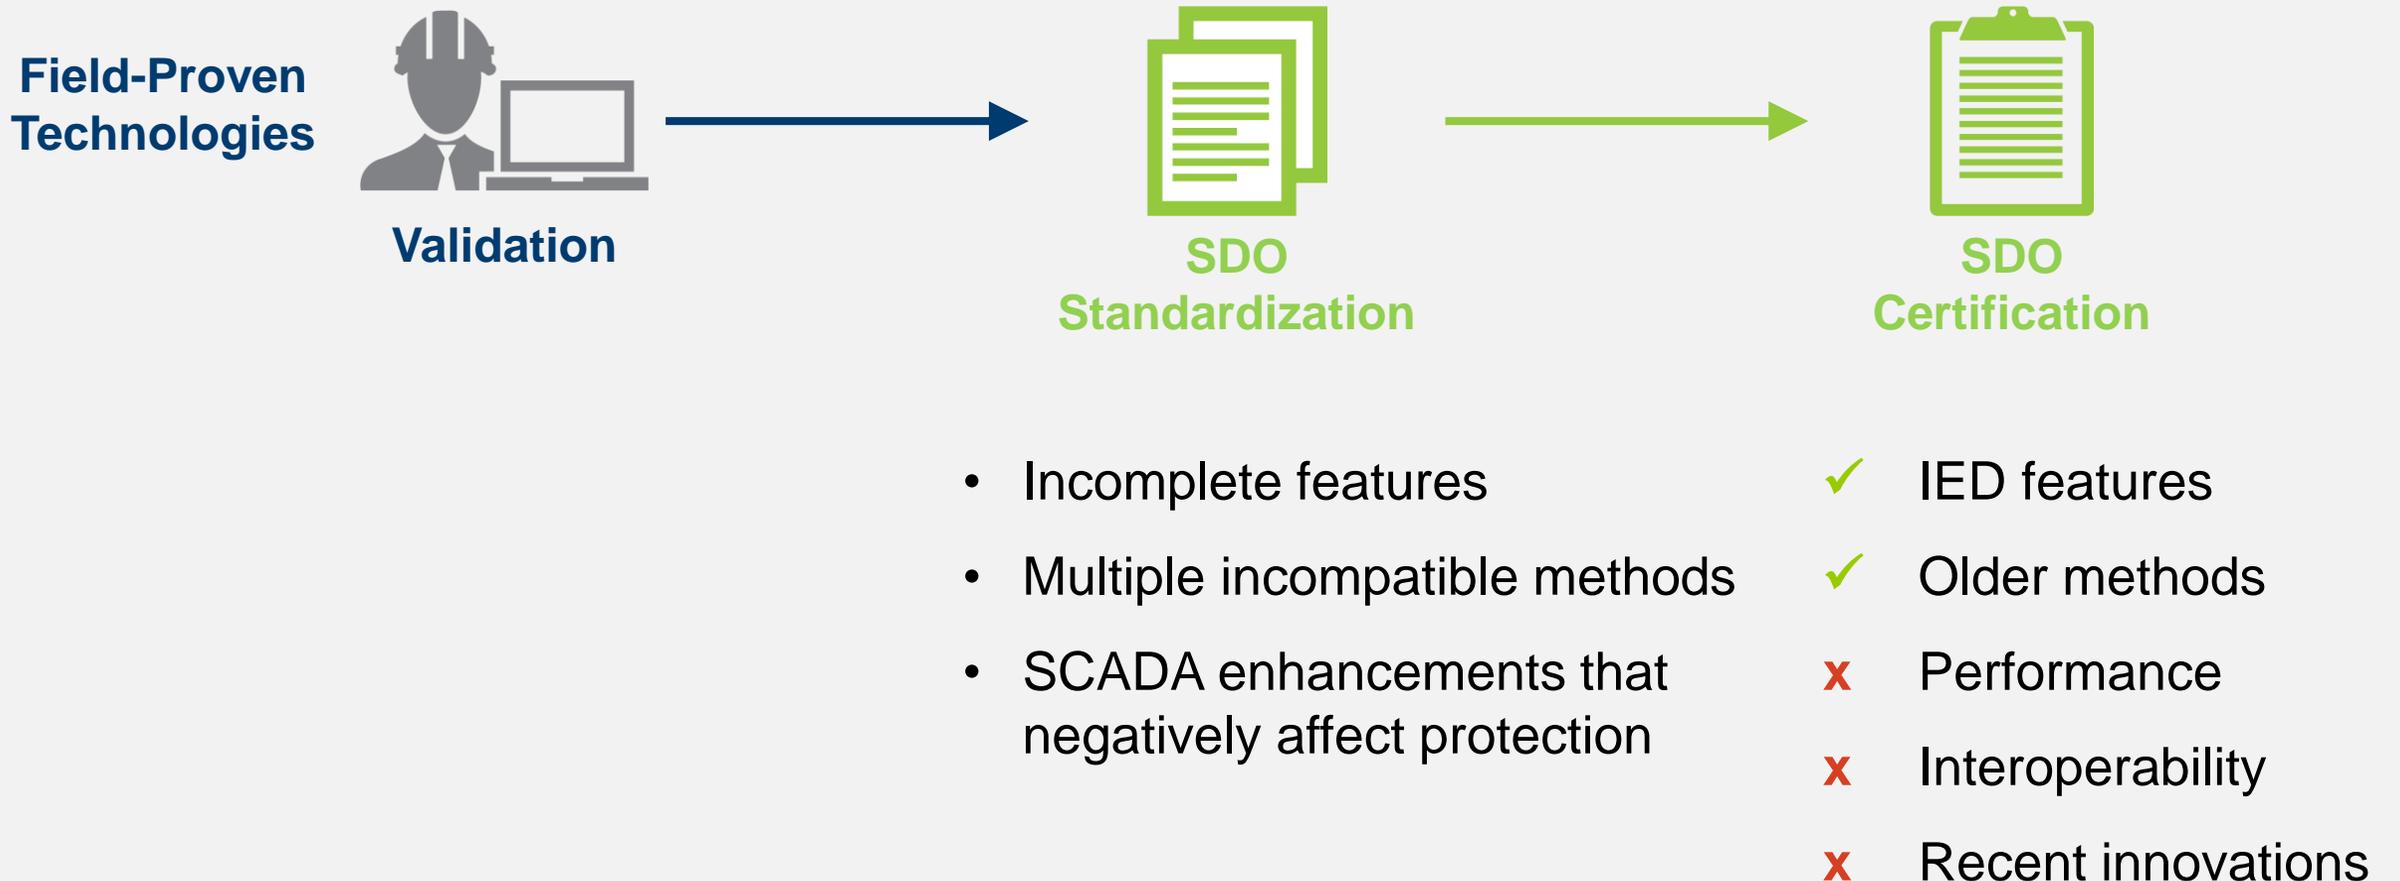

2017

“How Do We Specify Edition 2?”

Six Out of Ten Parts of IEC 61850 Are Now Edition 2

Committee Standardized Requirements With Unintended Consequences

“How Do We Specify Edition 2?”

Six Out of Ten Parts of IEC 61850 Are Now Edition 2

Committee Standardized Requirements With Unintended Consequences

- **Edition 2 now certifies many device features available for 10+ years**
- **Similar to today's 10X initiative, many features used 10 years before they were certified**
- **Standardized features 8+ years old**
- **Certified features 10+ years old**
- **Inhibits innovation**

Message Delivery Performance Criteria Defined by International Standards

- IED performance requirements
IEC 61850, IEC 60834, IEC 15802, IEEE 802.1
- Latency specifications
IEC 61850, IEC 60834, IEC 15802, IEEE 802.1
- Speed
IEC 61850

International Standards Dictate SLS for IED and LAN

Speed, Dependability, Reliability, and Performance

Signal exchange success > 99.99% of the time

- Signal transfer between devices is <3 ms*
- Ethernet transit via LAN is <1 ms

The only criteria defined by IEC 61850*

International Standards Dictate SLS for IED and LAN

Speed, Dependability, Reliability, and Performance

- LAN failures during signal exchange must be corrected fast enough to maintain protection and automation
- Device Ethernet failover must occur within 1 processing cycle

Ethernet Resiliency Requirements for Bumpless Protection Signal Transfer

- Boolean protection logic, <4 dropped GOOSE packets and <15 ms outage
- Analog protection calculations, <3 dropped SV packets and <433 μ s outage

Service Level Agreements (SLAs) Document That System Is Designed to Meet SLS Performance

TABLE I
EXAMPLE KPI METRIC DESIGN

KPI Component	Description
Metric	Availability of communications-assisted protection scheme measured as successful receipt of each Ethernet GOOSE packet from publisher.
Target Performance Level	Zero undelivered GOOSE messages received from publisher since last IED reset.
Format1	Message failure indication in real time as IED front-panel HMI alarm.
Interval1	Updated in real time.
Format2	Message failure indication in real time as status to substation monitor and SCADA via digital messages.

- System provider and end user agree on acceptable service
- Key performance indicators (KPIs) identified in system specification
 - Metric
 - Performance target
 - Format of measurement
 - Interval of metric

IED GOOSE Event Reports

Subscriber Records Delayed and Lost Packets and Provides SLA KPIs for Protection Signal Exchange

This screenshot shows the 'G1 EDITION 2 90-4 TEST STATUS' report. The header includes 'Goose Testing', the date '05/05/2017', and the time '15:37:25'. The report lists several key performance indicators (KPIs) for the protection signal exchange.

Parameter	Value
G1 PING:	3 MSEC
G1 PONG:	6 MSEC
G1 QUALITY:	GOOD
G1 TEST:	TRUE
LAN A LINK:	ACTIVE
LAN B LINK:	FAILED

Navigation icons (back, up, down) are visible on the left side of the screen. At the bottom right, there are icons for 'LR' and 'ACC'.

This screenshot shows the 'EDITION 2 90-4 TEST SUMMARY' report. The header includes 'Goose Testing', the date '02/05/2017', and the time '16:33:25'. The report provides a summary of delayed and lost packets, along with maximum signal outage.

Event Type	Count
DELAYED PACKET EVENTS:	1
LOST PACKET EVENTS:	2
MAXIMUM LOST PACKETS:	3
TOTAL LOST PACKETS:	4
MAXIMUM SIGNAL OUTAGE:	6 MSEC

Navigation icons (back, up, down) are visible on the left side of the screen. At the bottom right, there are icons for 'LR' and 'ACC'.

Certified Edition 2 LGOS

Very Little Information Included

Limited Vulnerability Design (LVD) Methods Lead to Better Understanding, Specifications

- Document applications *and* services
- Identify and investigate design gaps
- Recognize vulnerabilities associated with gaps
- Recognize risks associated with vulnerabilities
- Design specification to limit vulnerability based on cost, schedule, and performance

Substation Automation Solutions Require 18 Communications Applications

1. Substation automation and remedial action.
2. Self-description of device database contents.
3. Communications parameter configuration.
4. Polling of data from the device via a client.
5. Reporting of data from the device.
6. Unsolicited notification of device alarms.
7. Commanded control from operators or automation logic.
8. Event-driven, peer-to-peer, machine-to-machine signal and status multicasting.
9. Frequency-synchronized multicasting of raw instrument transformer values.
10. Time synchronization.
11. Configuration revision management.
12. File transfer.
13. Engineering access.
14. Detection of failed remote connection and callout.
15. Communications and performance diagnostics.
16. Local- and wide-area synchrophasors.

LVD Requires Understanding Gaps, Vulnerabilities, and Risks

Technical Gaps

- 6 Unsolicited notification of device alarms
- 11 Configuration revision management
- 13 Engineering access
- 14 Detection of failed remote connection and callout
- 15 Communications and performance diagnostics
- 16 Local- and wide-area synchrophasors
- 17 Root-cause analysis
- 18 Time-domain synchronized ultra-high-speed data acquisition

Vulnerabilities and Mitigations

- 6 No event summaries with fault location
- 11 Private end-user processes
- 13 Nonstandard Telnet and webpages
- 14 No redundant or out-of-band SCADA backup
- 15 No performance metrics and diagnosis
- 16 IEEE C37.118 Synchrophasor Protocol
- 17 No root-cause analysis
- 18 No time-domain synchronized process bus

ECS Identified 63 Features New to Edition 2, Process Lag Means 54 Are Not Certified

And Many Features Not Yet Standardized in IEC 61850

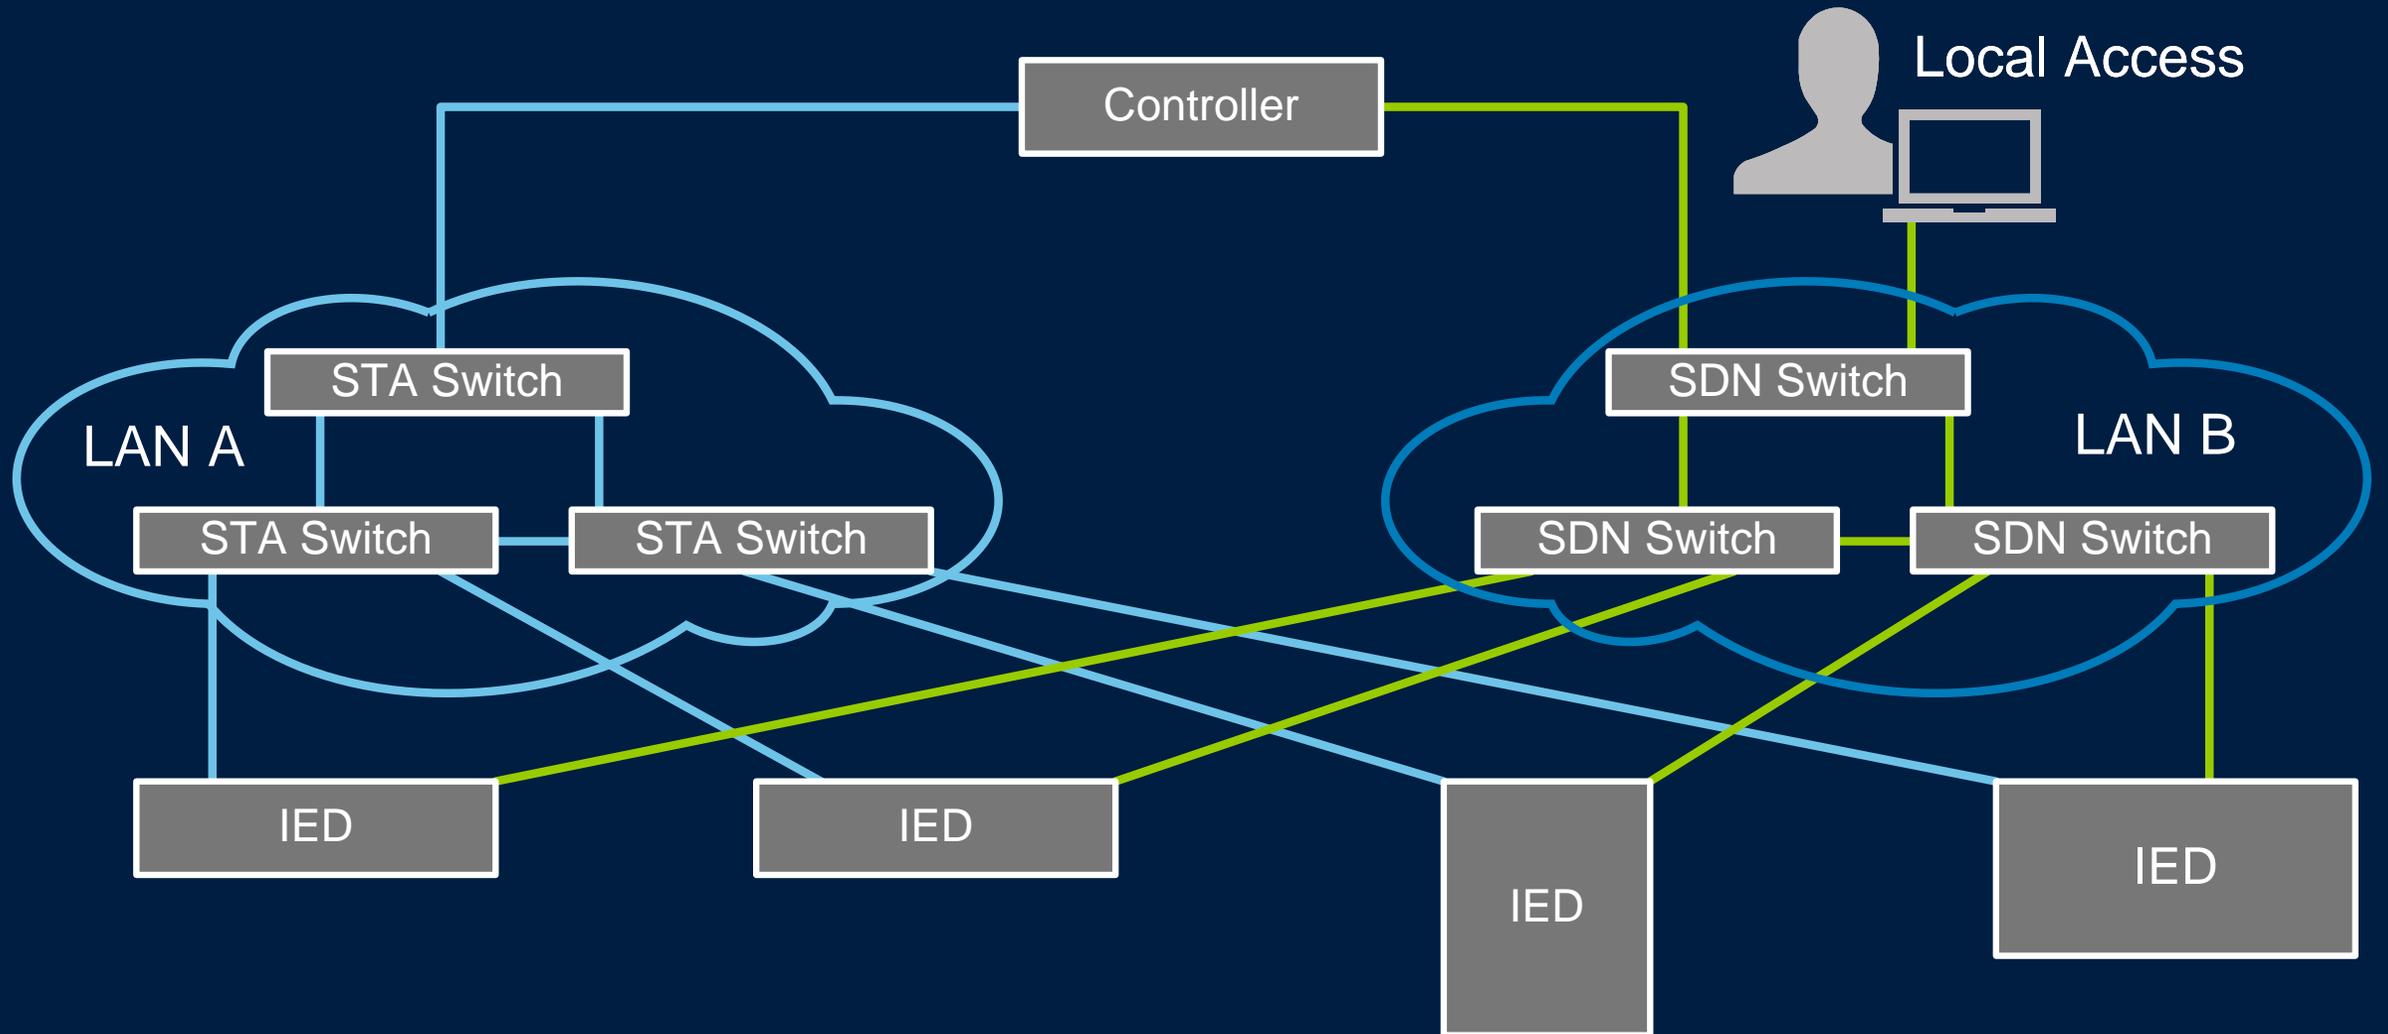

**Numerous International
Standards**

10X Features

- **Security**
- **Configuration**
- **Management**
- **Engineering Access**
- **Testing and KPIs**

**Designed to Support
Migration to SDN**

Performance and Security Improved by Software Defined Network (SDN)
